Continuation of 11, does NOT place the application in condition for allowance because: The Action of 16 Oct. 98 is maintained. Regarding the arguments filed 19 Jan. 20(1), Fox discloses a transfer transistor (16), tese transistor (20) and drain transistor (22) with gate nodes (TcK, RST and EC respectively) that are controlled by a driver unit (2). The claim language "configured such that an exposure time of the photoelectric converting element starts while the processing unit reads the signal charge from part and the transfer transistor transfers the signal charge from the photoelectric converting element after the floating diffusion part is reset" describes an intended use of the driver unit. The driver unit and gate nodes of the pixel disclosed by Fox are configured to pape 12 that Fox does not specify starting an exposure time of a converting element after a transistor transfers and a charge holding region is not persuasive because Fox is capable of starting an exposure time of the converting element (12) after the transistor (16) transfers the charge to a charge holding region is not persuasive because Fox is capable of starting an exposure time of the converting element (12) after the transistor (16) transfers the charge to a charge holding region (18). Regarding the amendments to the claims, as claimed in claim of the driver unit of Fox is capable of the transfer transistor simultaneously transfers the signal charge form all photoelectric converting elements to the charge holding region and also capable of an exposure time of the photoelectric converting elements so the charge holding region and also capable of an exposure time of the photoelectric converting elements so the charge holding region and also capable of the transitor.
